

01 TEAM DETAILS

UdyamPulse

An explainable MSME Financial Health Card built for IDBI Innovate 2026.

Team name	Looper
Team leader name	Bhunesh Bansal
Problem Statement	Problem Statement 3 — Financial Health Score

02 BRIEF ABOUT THE IDEA

Consented alternate data, turned into a decision a bank can defend.

01 What it is.

An explainable MSME Financial Health Card that scores businesses from consented alternate data.

03 Inputs.

GST filings, UPI transaction trails, Account Aggregator bank statements, EPFO records.

02 Who it's for.

New-to-Credit (NTC) and New-to-Bank (NTB) MSMEs that traditional bureau-based underwriting rejects outright.

04 Outputs.

A 0–100 score, an A–E grade, an eligible credit limit, and a plain-language improvement plan.

Explainability and auditability, by default.

DIFFERENTIATION

Beyond a number

Most alternate-data scoring tools return a score. UdyamPulse returns a decision a bank can defend to a regulator and a borrower can act on.

APPROACH

Two engines, one verdict

Independent, cross-checkable scoring methods run side by side and show explicitly what bureau-only underwriting would have decided vs. alternate data.

USP

The regulatory gap

Of 127 AI-using regulated entities surveyed, only 15 use SHAP/LIME explainability and only 18 keep audit logs (RBI). UdyamPulse ships both by default.

What the health card actually does.

5-Pillar Health Score

Liquidity, Discipline, Momentum, Leverage, Digital Footprint → 0–100 score, A–E grade, eligible limit.

Explainable ML + Shapley

A trained model with exact per-feature Shapley attribution behind every decision — no black box.

Traditional vs. Alternate Verdict

Side-by-side comparison showing the rejected-to-approved reversal for thin-file businesses.

Improvement Plan + Audit Log

A concrete action plan for borrowers, and an append-only audit trail for every decision made.

From consented data to an auditable decision.

01

Data intake

AA statements, GST, UPI, EPFO

02

Dual scoring

Rule engine + ML model, in parallel

03

Verdict & explain

Traditional vs. alternate, Shapley reasons

04

Memo & audit

Underwriter memo, decision logged

The rejected → approved moment.

The NTC hero (Shree Ganesh Textiles) has zero bureau history — declined instantly by a traditional process, approved on alternate data by UdyamPulse.

TRADITIONAL (BUREAU-ONLY)

Rejected

No credit bureau history on file (New-to-Credit / New-to-Bank).

UDYAMPULSE (ALTERNATE DATA)

Approved

Grade A · Score 86/100 · Eligible limit ₹27,00,000.

One service. Two engines. A full audit trail.

Single FastAPI Service

One process serves the API and the frontend — one Dockerfile, one deploy target.

Rule + ML Dual Engine

Transparent 5-pillar rules alongside a trained model with exact Shapley attribution.

Memo Layer

Deterministic by default; optional AWS Bedrock Runtime provider is wired for Stage 2.

Audit & Compliance Log

Every decision recorded; serverless-safe, in-memory-first design.

08 TECHNOLOGIES USED

A stack chosen for zero dependency risk.

Backend	Python, FastAPI, Pydantic, pytest
ML layer	Dependency-free linear regression model with closed-form Shapley attribution — no numpy, scikit-learn, or shap required
Frontend	Vanilla HTML / CSS / JS, no build step
Deployment & CI	Docker, Render web service, render.yaml Blueprint, GitHub Actions
Stage 2 targets	IDBI sandbox credentials, repayment labels, recalibration report, XGBoost / LightGBM + SHAP, persistent audit store

Near-zero to prototype. Scoped jointly for Stage 2.

The prototype runs entirely on an open-source stack and free-tier hosting. Stage 2 production cost scales with transaction volume and is best scoped jointly with IDBI during the sandbox mentorship phase, once real data volume is known.

The live underwriter cockpit.

Captured from the Render deployment: portfolio impact, case queue, explainable health card, audit controls, source map, and borrower plan in one surface.

IDBI INNOVATE 2026 · PS3 MSME FINANCIAL HEALTH SCORE

UdyamPulse underwriter cockpit

Consented alternate data becomes a defensible health card, eligible credit line, audit trail, and borrower improvement plan in one review surface.

Audit events

2

Governance rail: controls, validation metrics, pilot KPIs, fairness slices, audit count, and 5 data-source signals.

Verified, not just claimed.

28/28

Automated tests passing

100%

Decisions with Shapley reasons

5

Source signals mapped

4

Live governance controls

Browser verification on the live Render app found no console errors and no horizontal overflow on desktop or mobile. Recalibration and validation APIs report source coverage, real-distribution profiles, KS, AUC, Gini, PSI drift, reason-code stability, and fairness gap checks, ready to run on IDBI sandbox data.

Stage 2 is plug-in ready.

Phase 1

Real data integration

Connect authenticated IDBI sandbox AA/GST/UPI/EPFO feeds to /sandbox/score and /sandbox/recalibration/report; recalibrate on real distributions.

Phase 2

Production ML model

Enable the optional XGBoost/LightGBM runtime with the shap library at production data volume.

Phase 3

Fairness & monitoring

Run the implemented fairness gap, PSI, and reason-code stability checks on production-scale data.

Phase 4

Bedrock-powered memos

Enable the optional AWS Bedrock provider in the pilot environment, with deterministic fallback.
